ABSTRACT

Aim: To study Anti-tumor effect and anti-oxidant status of Euphorbia thymifolia Linn  
Materials & Methods: The present study deals with life span of Ehrlich ascites carcinoma bearing hosts, peritoneal cell count, hematological profile, solid tumor mass and biochemical parameters such as lipid peroxidation, reduced glutathione, superoxide dismutase and catalase activities. Results: Euphorbia thymifolia at oral dose of 200mg/kg prolongs the life span of Ehrlich ascites carcinoma-tumor bearing mice and causes significant increase in number of peritoneal cell count and significant decrease in volume of solid tumor mass compared to Ehrlich ascites carcinoma bearing control animals. Hematological profile including Red blood cells count, White blood cells count, Hemoglobin and protein estimation were found to be nearly normal levels in extract treated mice compared to tumor bearing control mice. Euphorbia thymifolia significantly decreased the levels of lipid peroxidation, reduced glutathione and significantly increased the levels of superoxide dismutase and catalase in treated group of animals. Conclusion: The results of the present study suggest that ethanolic extract of Euphorbia thymifolia is an effective anti oxidant and anti tumor activity against Ehrlich ascites carcinoma tumor in mice.
KEY WORDS: Anti-oxidants, Ehrlich ascites carcinoma, Euphorbia thymifolia.

INTRODUCTION
Cancers figure among the leading causes of death worldwide, accounting for 8.2 million deaths in 2012. \[1\] An extremely promising strategy for cancer prevention today is chemoprevention, which is a way to prevent or delay the development of cancer by taking medicines, vitamins or other agents in humans. \[2\] Many chemotherapeutic drugs used in cancer treatment are derived from plants. They are developed after rigorous clinical trials for safety and efficacy. There is a growing interest in the pharmacological evaluation of various plants used in Indian traditional system of medicine.

The plants Euphorbia thymifolia Linn belongs to family Euphorbiaceae popularly known as Chhoti dudhi, is a small prostate, hispidly pubescent, annual weed, which is commonly found in India & tropical countries. It is believed to possess diuretic, laxative & detumescent, antimalarial, anti-diarrheic, anti-rash, anti-dysentery, anti-carbuncle detoxification and anti-hemorrhoidal activity. \[3\] Charaka prescribed Dudhika as an ingredient of vegetable soup for diarrhoeal and painful bleeding piles. \[4\] Euphorbia thymifolia possess anti-oxidant and antiviral activities. \[5\] The plant is also used to treat eye swelling and discharge. \[6\]

Plant derived natural products such as tannins, flavonoids, terpenoids and steroids etc have received considerable attention in recent years due to their diverse pharmacological properties including anti-oxidant and anti-tumor activity. \[7,8\] Antioxidants play an important role in inhibiting and scavenging radicals, thus providing protection to humans against infection and degenerative diseases. \[9\] From this view point the present study was carried out to evaluate the antitumor activity, lipid peroxidation and antioxidant status of Euphorbia thymifolia against Ehrlich ascites carcinoma [EAC] in swiss albino mice.

MATERIALS AND METHODS
Plant material
The whole plant of Euphorbia thymifolia was collected around Bangalore city and was identified by Prof. Jawahar Raveendran, in charge-Raw Drug Repository, FRLHT, Bangalore, Karnataka, where a voucher specimen [FRL/CRJ/RDRNO/90/2008-09] is deposited.
Extraction
The plant was shade dried, powdered and extracted by using Soxhlet apparatus with ethanol. After extraction, the filtrate was concentrated under reduced pressure.

Phytochemical screening
Preliminary phytochemical screening of Euphorbia thymifolia revealed the presence of steroids, glycosides, flavonoids, tannins, tri terpenoids & phenolic compounds. [10-11]

Tumor cells
EAC cells were obtained from the courtesy of department of Radiology, Kasturba Medical College, Manipal, India. The EAC cells were maintained by intra peritoneal inoculation of 1 × 10⁶ cells/mouse.

Animals
Swiss albino mice were procured from Raghavendra Enterprises, Bangalore. The mice were grouped and housed in polyacrylic cages (38 X 23 X 10 cm) with not more than ten animals per cage and maintained under standards laboratory conditions [temperature 25 ± 20 °C ] with dark/light cycle [14/10h] They were allowed free access to standard dry pellet diet and water ad libitum. The mice were acclimatized to laboratory conditions for 10 days before commencement of the experiment. All procedures described were reviewed and approved by the institutional animal ethical committee CPCSEA No. (997/C/06/CPCSEA).

Acute toxicity study
The acute oral toxicity study was carried out as per guidelines set by organization for Economic Co-operation and Development [OECD] Guidelines No. 423. [12] Healthy adult Swiss albino mice weighing between 25 to 35 gm were used for the study. Animals were divided into four groups of three animals each and kept fasted for overnight. The different doses like 5, 50, 300, 2000 mg/kg body weight were administered. Based on the result, the extract did not produce any mortality at the doses tested. To optimize the dose levels 1/10th of LD₅₀ [200 mg/kg body weight] ethanolic extract was selected for the evaluation.

Antitumor activity
Male Swiss albino mice were then divided into three groups containing ten mice. All the groups were injected with EAC cells [1 × 10⁶ cells/mouse] intraperitoneally except the normal group. This was taken as day zero.
Survival time
Group I: EAC bearing mice, treated with 0.9% normal saline, Group II: EAC bearing mice, treated with ethanolic extract of Euphorbia thymifolia 200 mg/kg, p. o. Group III: Tumor bearing mice, treated with 5-fluorouracil 20 mg/kg, i. p. The antitumor efficacy of ethanolic extract of Euphorbia thymifolia was compared with that of 5-fluorouracil. The mean survival time of the treated groups was compared with that of the control group using the following calculation:

\[
\text{Increase in lifespan} = \frac{T - C \times 100}{C}
\]

Where \( T \) = average number of days the treated animals survived, \( C \) = average number of days control animals survived.

Effect of ethanolic extract of Euphorbia thymifolia on normal peritoneal cells
Animals were divided into three groups. Each group consisted of six animals. Group I: Vehicle control, Group II: Mice + treated with ethanolic extract of Euphorbia thymifolia 200 mg/kg, p.o. only once for a single day, Group III: Mice + treated with ethanolic extract of Euphorbia thymifolia 200 mg/kg, p.o. for two consecutive days. Peritoneal cells were collected after 24 h treatment by repeated intraperitoneal wash with normal saline and peritoneal cells were counted using neuber’s chamber and compared the result of treated groups with those of the untreated group. Total no. of cells = total no. of cells count into neuber’s chambers \( \times D.F \times 104 \)

Hematological parameters
Group I: treated with 0.9% normal saline, Group II: EAC bearing mice, treated with 0.9% normal saline, Group III: EAC bearing mice, treated with ethanolic extract of E. thymifolia 200 mg/kg, p.o. On 14\textsuperscript{th} day after tumor inoculation blood was drawn from each mouse by the tail vein and the white blood cell count, red blood cell count, hemoglobin content, protein estimation and differential count were determined. \textsuperscript{[13]} Compared the result of treated groups with those of the untreated group. Total no. of cells = total no. of cells count into neuber’s chambers \( \times D.F \times 104 \)

Biochemical assay
After the collection of blood samples, the mice were sacrificed, then their liver was excised, rinsed in ice, cold normal saline and used for estimation of lipid peroxidation, \textsuperscript{[14]} reduced glutathione, \textsuperscript{[15]} Superoxide dismutase, \textsuperscript{[16]} & Catalase. \textsuperscript{[17]}
Effect of ethanolic extract of Euphorbia thymifolia on solid tumor
Mice were divided into two groups. Each group consists of eight animals. Tumor cells (1 X10^6 cells/mice) were injected into the right hind limb (thigh) of all experimental animals intramuscularly. Group I: EAC bearing mice, treated with 0.9% normal saline, Group II: EAC bearing mice, treated with ethanolic extract of Euphorbia thymifolia 200 mg/kg, p.o for 05 alternative days. Tumor mass was measured from the 11th day of tumor induction. The measurement was carried out every 5th day for a period of 30 days. The volume of tumor mass was calculated using the formula: \[ V = \frac{4}{3}\pi r^2 \] Where \( r \) is radius of the tumor mass

RESULTS
Effect of ethanolic extract of Euphorbia thymifolia on survival time of EAC bearing mice
The effect of ethanolic extract of Euphorbia thymifolia on the survival of EAC bearing mice was showed in Table 1. The mean survival time for the control group was 16.9 ± 0.64 days, whereas for the treated group with Euphorbia thymifolia was 28.10 ± 0.58 days. The increased in life span of EAC bearing mice treated with Euphorbia thymifolia and 5-Fluorouracil was found to be 66.63% and 96.75% respectively as compared to vehicle control group.

Effect of ethanolic extract of Euphorbia thymifolia on normal peritoneal cell count
The average number of peritoneal cells per normal mouse was found to be 5.32 ± 0.28. Single day treatment with Euphorbia thymifolia enhanced peritoneal cells to 7.08 ± 0.17, while two consecutive treatments groups it was enhanced the number to 9.072± 0.23.

Effect of ethanolic extract of Euphorbia thymifolia on hematological parameters of EAC bearing mice
Red blood cells count and hemoglobin content in EAC bearing control group was significantly decreased compared to vehicle control group. Treatment with Euphorbia thymifolia at the dose of 200 mg/kg significantly increased the RBC count and hemoglobin content compared to EAC bearing mice. The total WBC count and total protein was found to be increased significantly in the EAC bearing control group when compared to normal control. Administration of Euphorbia thymifolia extract in EAC bearing mice significantly reduced the WBC count and total protein as compared with EAC bearing control group. In differential count of WBC, the presence of neutrophils increased, while lymphocytes count decreased in the EAC bearing control group. While in the Euphorbia thymifolia treated group
changed those altered parameters more or less to the normal values. Results are explained in Table 3.

**Effect of ethanolic extract of Euphorbia thymifolia on biochemical estimation**

Antioxidant enzyme level in EAC bearing mice were altered during diseased condition and all the enzymes brought back to normal level after the treatment with Euphorbia thymifolia. The antioxidant potential of Euphorbia thymifolia was evaluated by estimating the antioxidant enzymes like superoxide dismutase, lipid peroxidation, reduced glutathione, and Catalase from the liver tissues of EAC bearing mice. Euphorbia thymifolia treated group significantly reversed the altered enzymes levels as compared to EAC bearing control group. Results are represented in Table 4.

**Effect of ethanolic extract of Euphorbia thymifolia on solid tumor**

There was markedly reduction in the tumor mass of Euphorbia thymifolia treated of EAC bearing mice. The tumor mass of EAC bearing control on 37th day was 2.94 ± 0.26, whereas in the extract treated group it was reduced upto1.16 ± 0.14. Results are presented in Table 5.

DISCUSSION

In Ehrlich ascites carcinoma bearing mice, a regular rapid increase in ascites tumor volume was noted. Ascites fluid is the direct nutritional source for tumor cells and a rapid increase in ascites fluid with tumor growth would be a means to meet the nutritional requirement of tumor cells. [19] Treatment with extract of Euphorbia thymifolia inhibited the tumor masses and the reliable criteria for judging the value of any anticancer drug are the prolongation of the life span of animals.

The extract of Euphorbia thymifolia decreased the ascites fluid masses and increased the percentage of life span. It may be concluded that, extract of Euphorbia thymifolia by decreasing the nutritional fluid volume and arresting the tumor growth, finally increased the life span of tumor bearing mice. [20]

Usually, in cancer chemotherapy the major problems that are being encountered are of myeloid-suppression and anemia. [21-22] The anemia encountered in tumor bearing mice is mainly due to reduction in RBC or hemoglobin content, and this may occur either due to iron deficiency or due to hemolytic or myelopathic conditions. [23] Treatment with Euphorbia thymifolia brought back the hemoglobin content, RBC and WBC count more or less to normal levels. This indicates that extract of Euphorbia thymifolia possesses protective action on the hemopoietic system.

The improper balance between ROMs ( Reactive Oxygen Metabolites) and antioxidant defenses results in “oxidative stress”, which deregulates the cellular functions leading to various pathological conditions including cancer. [24] ROMs overproduction induced by
different exogenous and endogenous mechanism may exhaust the antioxidant system of cells and contribute to a number of destructive processes and diseases, including cancer. [25] Epidemiological studies have suggested that high endogenous level of oxidative adducts and deficiencies in antioxidant levels are likely to be important risk factors for cancer. [26]

Lipid peroxidation, an autocatalytic free radical chain propagating reaction, is known to be associated with pathological conditions of a cell. Malondialdehyde was the end product of lipid peroxidation was reported to be higher in cancer tissues than in non-diseased organ. [27] It was also reported that the presence of tumors in the human body or in experimental animals was known to affect many functions of the vital organs, especially in the liver, even when the site of the tumor does not interfere directly with organ function. [28] The extract of Euphorbia thymifolia significantly reduced the elevated levels of lipid peroxidation and glutathione content in EAC-treated mice. The anti-tumorogenic effect of Euphorbia thymifolia may be due to the antioxidant and the free radical quenching property of the phytoconstituents of Euphorbia thymifolia.

Cells are also equipped with enzymatic antioxidant mechanisms that play an important role in the elimination of free radicals. SOD, CAT is involved in the clearance of superoxide and hydrogen peroxide (H\textsubscript{2}O\textsubscript{2}). SOD catalyses the diminution of superoxide into H\textsubscript{2}O, which has to be eliminated by glutathione peroxidase and/or catalase. [29] Consistent with this, it has been reported that a decrease in SOD activity in tumor bearing mice may be due to loss of Mn\textsuperscript{2+}-containing SOD activity in Ehrlich ascites carcinoma cells and the loss of mitochondria, leading to a decrease in total SOD activity in the liver. [30] A small amount of catalase in tumor cells was reported. [30] The inhibition of SOD and CAT activities as a result of tumor growth were also reported. [31] Similar findings were observed in the present investigation with EAC-bearing mice. The administration of ethanolic extract of Euphorbia thymifolia at dose 200 mg/kg significantly increased the SOD and CAT levels.

The effect of Euphorbia thymifolia treatment on the peritoneal cells of normal mice was an indirect method of evaluating its inhibitory effect on tumor cell growth. Normally, a mouse contains about 5.13 X 10\textsuperscript{6} peritoneal cells, 50% of which are macrophages. The extract of Euphorbia thymifolia treatment was found to enhance the peritoneal cells count. These results demonstrate that indirect inhibitory effect of extract of Euphorbia thymifolia on Ehrlich ascites carcinoma cells, which is probably mediated by the enhancement and activation of macrophages. [18] It was reported that plant-derived extracts containing antioxidant principles
showed cytotoxicity towards tumor cells \[^{32}\] and antitumor activity in experimental animals. \[^{33}\] Antitumor activity of these antioxidants is either through induction of apoptosis \[^{34}\] or by inhibition of neovascularization \[^{35}\], the implication of free radicals in tumors is well documented. \[^{36}\]-\[^{37}\]

Plant derived natural products viz., tannins, flavonoids, terpenoids and steroids etc have received considerable attention in recent years due to their diverse pharmacological properties including anti-oxidant and anti-tumor activity. \[^{7}\]-\[^{8}\] Preliminary phytochemical screening of Euphorbia thymifolia revealed the presence of steroids, glycosides, flavonoids, tannins, tri terpenoids & phenolic compounds. The above parameters are responsible for the antitumor and anti-oxidant activities of Euphorbia thymifolia. Further investigations are in progress to identify the active principles involved in this antitumor and antioxidant activity.
