ABSTRACT
The aim is to analyse and study the phytochemical constituents present in Ocimum basilicum leave. Preliminary Phytochemical analysis of aqueous methanol extract of Ocimum basilicum leaves revealed the presence of bioactive constituents such as alkaloids, anthraquinones, coumarins, flavonoids, saponins, phlobatannins, tannins and terpenoids. These constituents were separated away on the basis of polarity of different solvents in to different fractions. These may be used in nutraceuticals and the food industry. However, additional studies are necessary to develop a method for the fractionation and identification of polyphenols and to determine the most active antioxidant compounds in the polyphenolic extract.

KEYWORDS: Ocimum basilicum leave, phytochemical screening, medicinal uses and TLC.

INTRODUCTION
Traditional medicinal plants has focused on the discovery of valuable drugs during the past few decades (Buenz et al., 2004). Polyphenols are naturally occurring compounds found largely in the fruits, vegetables, cereals and beverages. Fruits like grapes, apple, pear, cherries and berries. Typically a glass of red wine or a cup of tea or coffee contains about 100 mg polyphenols. Cereals, dry legumes and chocolate also contribute to the polyphenolic intake (Scalbert et al., 2005 and Spencer et al., 2008). Polyphenols are secondary metabolites of...
plants and are generally involved in defense against ultraviolet radiation or aggression by pathogens (Beckman, 2000).

Distribution of phenolics in plants at the tissue, cellular and sub cellular levels is not uniform. Insoluble phenolics are found in cell walls, while soluble phenolics are present within the plant cell vacuoles (Adlercreutz and Mazur, 1997). Certain polyphenols like quercetin are found in all plant products; fruit, vegetables, cereals, fruit juices, tea, wine, infusions etc., whereas flavanones and isoflavones are specific to particular foods. In most cases, foods contain complex mixtures of polyphenols.

The outer layers of plants contain higher levels of phenolics than those located in their inner parts (Simon et al., 1992). Numerous factors affect the polyphenol content of plants, these include degree of ripeness at the time of harvest, environmental factors, processing and storage. Polyphenolic content of the foods are greatly affected by environmental factors as well as edaphic factors like soil type, sun exposure, rainfall etc. The degree of ripeness considerably affects the concentrations and proportions of various polyphenols (Manach et al., 2004). Many polyphenols, especially phenolic acids, are directly involved in the response of plants to different types of stress: they contribute to healing by lignification of damaged areas possess antimicrobial properties, and their concentrations may increase after infection (Parr et al., 2000).

**Role of Polyphenols**

Polyphenols are a group of secondary metabolites substances in plants are usually subdivided into two groups: flavonoids and non flavonoids. The most common flavonoids in plants are flavonols (quercetin, kaempferol, and myricetin), flavan-3-ols (catechin, epicatechin, and tannins), and anthocyanins (cyanin). Non flavonoids comprise stilbenes, hydroxyl cinnamic acids and benzoic acids (Arnous, et al., 2002).

Phenolic acids, flavonoids and tannins are the most commonly found polyphenolic compounds in plant extracts (Naiket al., 2006). Flavonoids are 15-carbon compounds generally distributed throughout the plant kingdom (Harborne, 1988). Flavonoids and many other phenolic compounds of plant origin have been reported as scavengers of reactive oxygen species (ROS), and are viewed as promising therapeutic drugs for free radical pathologies (Parshadet al., 1998; Chang et al., 2007).
Tannins are naturally occurring, high molecular weight polyphenols which can be divided into hydrolysable tannins and condensed tannins. Tannins are the most abundant antioxidants in the human diet and they exhibit many biologically important functions which include protection against oxidative stress and degenerative diseases.

MATERIALS AND METHODS

Sterilization of Glassware
Glassware were soaked overnight in cleaning solution and washed thoroughly with running tap water. They were then cleaned with detergent solution and rinsed several times with tap water and finally in distilled water and air dried. The glassware and media were sterilized in an autoclave at 15psi for 20 minutes, at 120°C.

Preparation of extracts
Organic solvents (methanol) extract of the *Ocimum basilicum* leaf were prepared according to the method described by Boaky-Yiadon (1979) with little modifications. Twenty grams of *Ocimum basilicum* leaf extract were air-dried, crushed and blended into powder using an electric blender for each solvent. The blended material was transferred to a beaker and soaked separately in 100 ml of the organic solvent at room temperature. The mixture was extracted by agitation on a rotary shaker. The extract obtained was vacuum-dried and used for further test.

Reagent
bismuth nitrates, Potassium iodide, Hcl, and Mercuric chloride. Na OH solution, 10% lead acetate solution, chloroform, and concentrated Sulphuric acid. FeCl3 (1%) and K3(Fe(CN)6).

glacial acetic acid
ferric chloride solution.

olive oil

Total phenolic content of *Ocimum basilicum* leaf methanol extract
The total phenolic content of *Ocimum basilicum* leaf methanol extracts was determined using the method by Gutfinger (1981). The DSM extract (1 mL, 1mg/mL) was mixed with 1 mL of 50% Folin-Ciocalteu reagent and 1 mL of 2%Na2CO3, and centrifuged at 13400 X g for 5 min. The absorbance of upper phase was measured using a spectrophotometer (Model UV-
1601; Shimadzu, Tokyo, Japan) at 750 nm after 30 min incubation at room temperature. TPC was expressed as a tannic acid equivalent.

**The Partial characterization of Thin Layer Chromatography in Ocimum basilicum leaf**

The flavonoid fraction of *Ocimum basilicum* leaf was loaded on to pre coated TLC (60 F2 54) and it was developed using solvent system in the ratio of 1:0.5:0.1(Hexane, Chloroform and Methanol) visible and the non-visible spot given and it is fluorescent with UV light at 360nm.

**RESULTS AND DISCUSSION**

Phytochemical screening provides basic information about medicinal importance of a plant extract. In this study evaluation for qualitative and quantitative estimation of the chemical constituents of *Ocimum baslicicum* extracts showed the presence of various secondary metabolites. Phytochemical analysis of aqueous methanol extract of *Ocimum basilicum* leaves revealed the presence of bioactive constituents such as alkaloids, anthraquinones, coumarins, flavonoids, saponins, phlobatannins, tannins and terpenoids. These constituents were separated away on the basis of polarity of different solvents in to different fractions. The biochemical investigation reports indicated the same composition of phyto chemicals for the crude methanol extract of different plants (Sahreen *et al.*, 2010; Sahreen *et al.*, 2011).

The phyto chemical screening of the *Ocimum basilicum* extract were studied presently showed the presence of flavonoids, poly phenols, and saponins (Table -1 and Figure-1).

**The Partial characteriztion of Ocimum basilicum by TLC**

The phenolic extract of *Ocimum basilicum* loaded on Pre-coated TLC plates (60 F2 54 Merck) and developed with a solvent system of Diaxon, tetra hydro furan and acetone in the
ratio of 6:6:1 were efficient to extract the anti-inflammatory compound it is used for further studies. The developed plate was viewed under UV 240nm and 360nm (Table-2 and Figure-2).

Total phenolic content of leaf extract of *Ocimum basilicum*

In this context, the preliminary experiments revealed that 80% methanol was the best solvent for the extraction of phenolics from *Ocimum basilicum* at 60 °C for 60 min since it afforded a maximum yield of phenolics. The yields leaf of *Ocimum basilicum* extracts ranged from 29% (w/w). Therefore, the total phenolic contents were reported as catechin equivalents (Figure-3 and Table-3).

CONCLUSION

Polyphenols are valuable plant constituents for the scavenging of free radicals because of their phenolic hydroxyl groups. This, together with the obtained results, suggests that as the amount of polyphenolic compounds increases, the antioxidant activity also increases. In conclusion, the present study demonstrates that the polyphenolic extract of *Ocimum basilicum* leave can be used in nutraceuticals and the food industry.
